## DESCRI PTI ON

Model 823 panel ammeters are specific instruments that allow direct connection to an external shunt for readout constant currents up to 2000A.

They are simple, low-cost indicators, without output or setpoint option, easy to install and put into operation.

Taking out the frontal lens provides access to decimal point location and to zero and span adjustment with a margin of $20 \%$.

Configuring the input for a specific shunt and scaling the display are available by opening the case and changing an internal resistor as shown next page.

Power and signal connection is realized by means of a MAT-N-LOK AMP 6 pins connector located at the rear of the unit.

The span adjustment is made by the potentiometer $(Z)$ located to the left, lower side of the display. Turning clockwise increases the display reading. The adjust margin is $\pm 20 \%$ of $F$.S.

The zero adjustment corresponds to the potentio- meter (W) located to the upper, left side of the display. Turning clockwise increases the display reading. The adjust margin is $\pm 200$ counts.

Max.thickness: 10 mm

## SCALI NG

To change the scale, calculate the value of the resistor R2 by applying the formula:
R2 (ohm) $=(100000 /((\mathrm{VD} / \mathrm{mV})-1))$
where:
VD = display value disregarding decimal point.
Example; for the 200A range (199.9), VD = 1999
$\mathrm{mV}=$ milivolts of the shunt.

## ACCESS TO CALI BRATI ON

Remove lens by placing an appropriate sized screwdriver in the slot and pushing laterally as it is shown in the figure until the lips disengange. For further configuration unscrew the rear nut to take the circuits out from the front of the case.
To reinstall lens, insert it completely from one side and press from the other until it is fitted.
